

#Hirerachy

- It is the 4th Major Pillar of OOP
- It means Reusability

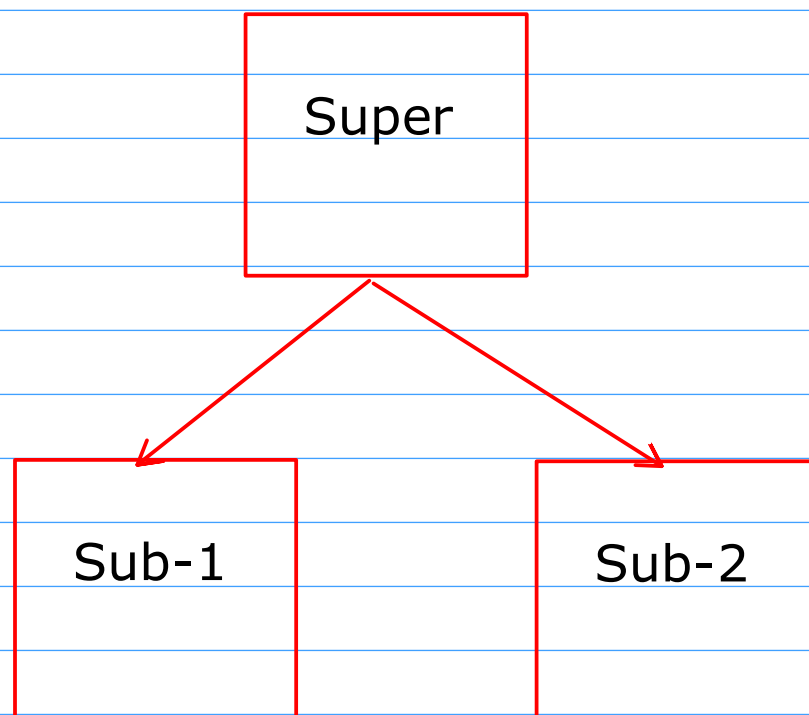

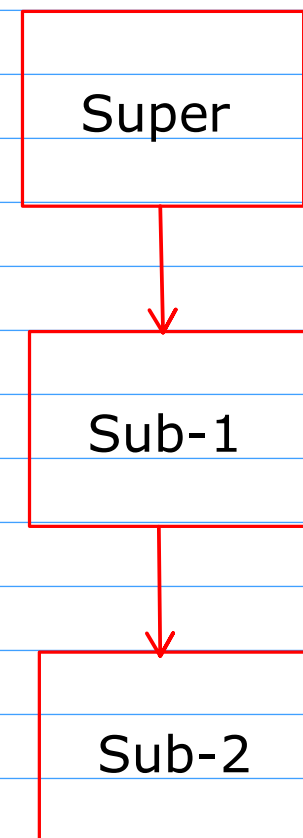

Types of Inheritance

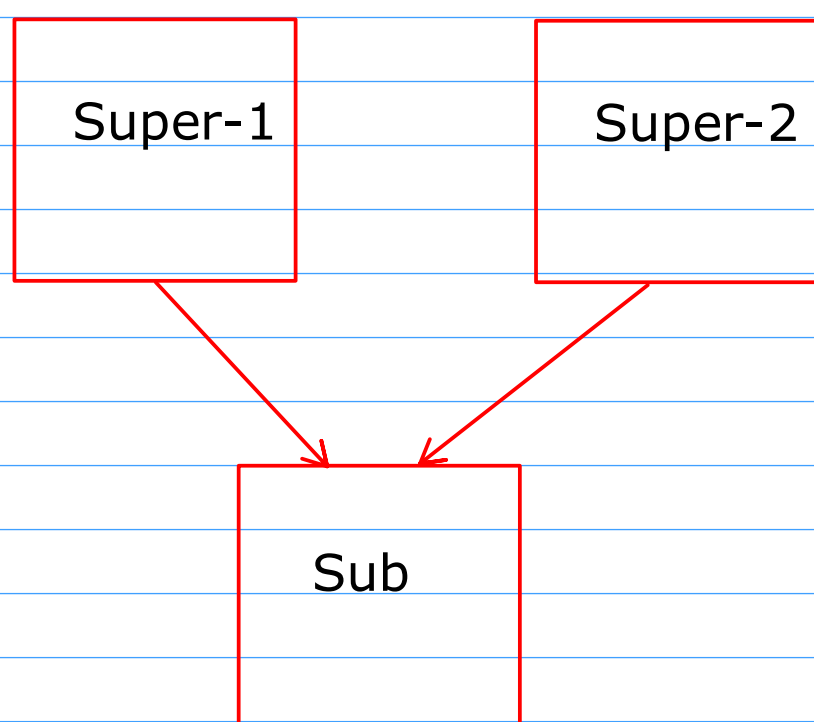

Single Inheritance

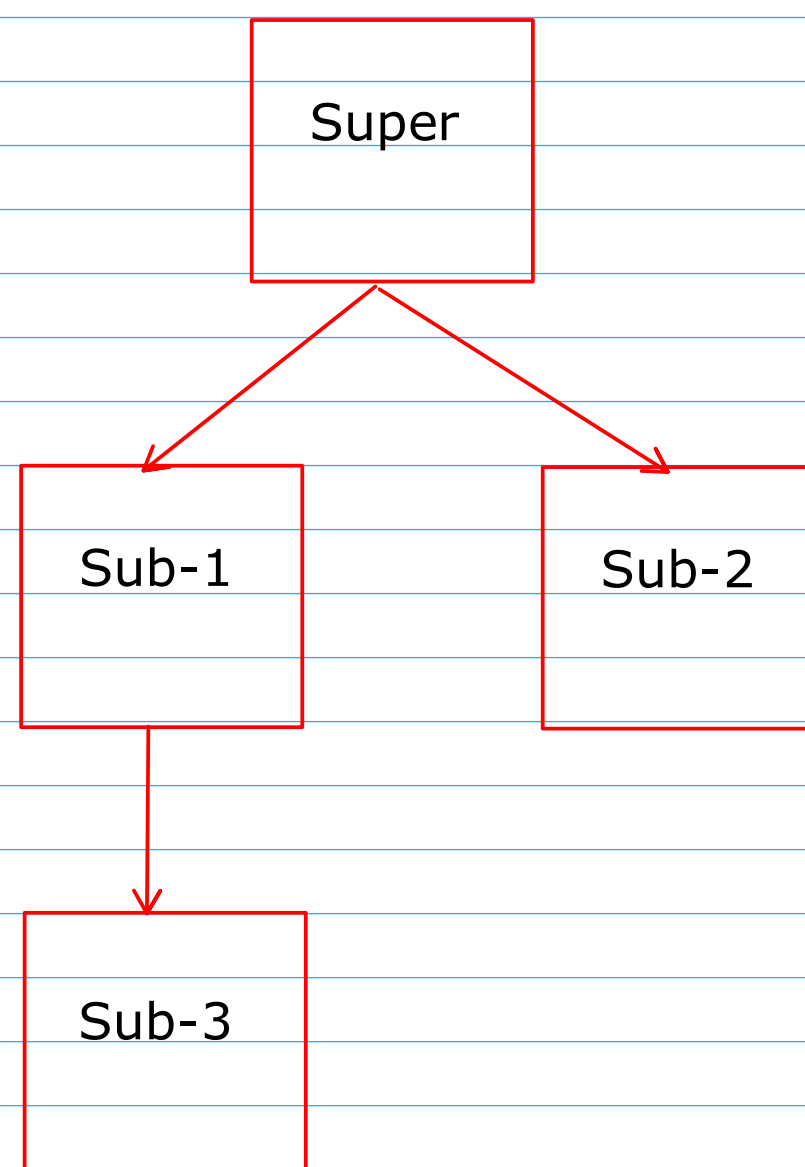

Hierarchical Inheritance

Multilevel Inheritance

Multiple Inheritance

Hybrid Inheritance (Mixing of different types of inheritance)

In Java Multiple class Inheritance is not supported

However

Multiple Interface Inheritance is supported

super keyword

- To access the members of the super class inside the subclass super keyword is used
- if we need to invoke the parameterized ctor of super class from sub class ctor we use super statement [super()]
- super() should be the first statement inside the ctor body
- to unhide the implementation of super class method into subclass after overriding

Method Overriding

- Defining the method of super class once again in subclass with same name and signature is called as method overriding
- When to perform method overriding
 1. When the implementation of super class methods are 100% incomplete
 2. When the implementation of the super class methods are partial complete
 3. When we need the implementation of super class method totally different in the sub class

Rules of Method Overriding
